

POWERING A PERFORMANCE-CENTRIC DATA CENTER WITH CONVERGEONE HYBRID CLOUD

Challenge

A large, global commercial airline needed cloud services and data center resources to be able to provide advanced co-op digital services to other airlines in a very strict time frame.

While the airline lacked the capacity and resources to migrate to new tool sets quickly, it urgently needed to modernize its environment. It required a partner that could work in a very agile manner to accommodate its need for immediate assistance.

Solution

ConvergeOne deployed a full Data Center Stack that was ready to plug into the airline's network and go right out of the gate. In under 30 days, ConvergeOne built and delivered the ConvergeOne Hybrid Cloud, which includes a Pure Storage and Cisco FlashStack converged infrastructure platform to power a performance-centric data center. A private cloud solution with high-speed compute, storage, and networking capabilities, it can support even the most demanding workloads.

Results

ConvergeOne was able to reduce its timeline by months to get the service environment platform up and running quickly, as well as **reduce data center floor space by a factor of five.**

Developers can now leverage tools and automation to deploy their new container-based applications.

ConvergeOne was able to modernize the applications in the environment and the customer is able to use the technology as both an internal cloud and a Platform as a Service (PaaS).
