

PROTECTING PATIENT DATA

Providing Advanced Protection and Recovery Against Ransomware Attacks

Challenge

A sizable human services provider had just finished creating several new Patient Database Projects, increasing the amount of patient data that needed to be protected.

It had recently started moving its workload to Microsoft Azure without any cloud workload protection.

Because so many patients rely on the healthcare provider services, it was important that its patient data be protected from ransomware attacks.

Solution

ConvergeOne completed a Dell Data Protection refresh and deployed an Integration Data Protection Appliance (IDPA) solution that consolidates and simplifies the data protection environment to a single solution for all workloads. The customer is now able to protect the patients data that is being migrated to Azure, accommodate for future growth, and recover from any future ransomware attacks.

Results

Patient data is more secured and protected than ever, with **1.4x more capacity** provided with the new IDPA solution compared to its previous solution.

IS YOUR ORGANIZATION READY TO PREVENT OR RECOVER FROM RANSOMWARE ATTACKS?
